

## **Probability Distributions: Discrete**

Introduction to Data Science Algorithms Jordan Boyd-Graber and Michael Paul SEPTEMBER 27, 2016

- Recall: the binomial distribution is the number of successes from multiple Bernoulli success/fail events
- The **multinomial** distribution is the number of different outcomes from multiple *categorical* events
  - It is a generalization of the binomial distribution to more than two possible outcomes
  - As with the binomial distribution, each categorical event is assumed to be independent
  - Bernoulli : binomial :: categorical : multinomial
- Examples:
  - The number of times each face of a die turned up after 50 rolls
  - The number of times each suit is drawn from a deck of cards after 10 draws

- Notation: let X
   be a vector of length K, where X
   k is a random variable
   that describes the number of times that the kth value was the outcome
   out of N categorical trials.
  - The possible values of each X<sub>k</sub> are integers from 0 to N
  - All  $X_k$  values must sum to  $N: \sum_{k=1}^{K} X_k = N$
- Example: if we roll a die 10 times, suppose it comes up with the following values:

$$\vec{X} = <1, 0, 3, 2, 1, 3>$$

 $X_2 = 0$   $X_3 = 3$   $X_4 = 2$   $X_5 = 1$  $X_6 = 3$ 

 $X_{1} = 1$ 

• The multinomial distribution is a *joint* distribution over multiple random variables:  $P(X_1, X_2, ..., X_K)$ 

• Suppose we roll a die 3 times. There are 216 (6<sup>3</sup>) possible outcomes:

$$P(111) = P(1)P(1)P(1) = 0.00463$$

$$P(112) = P(1)P(1)P(2) = 0.00463$$

$$P(113) = P(1)P(1)P(3) = 0.00463$$

$$P(114) = P(1)P(1)P(4) = 0.00463$$

$$P(115) = P(1)P(1)P(5) = 0.00463$$

$$P(116) = P(1)P(1)P(6) = 0.00463$$

$$\dots \dots \dots$$

$$P(665) = P(6)P(6)P(5) = 0.00463$$

$$P(666) = P(6)P(6)P(6) = 0.00463$$

• What is the probability of a particular vector of counts after 3 rolls?

- What is the probability of a particular vector of counts after 3 rolls?
- Example 1:  $\vec{X} = <0, 1, 0, 0, 2, 0>$

- What is the probability of a particular vector of counts after 3 rolls?
- Example 1:  $\vec{X} = <0, 1, 0, 0, 2, 0>$

• 
$$P(\vec{X}) = P(255) + P(525) + P(552) = 0.01389$$

- What is the probability of a particular vector of counts after 3 rolls?
- Example 1:  $\vec{X} = <0, 1, 0, 0, 2, 0>$

• 
$$P(\vec{X}) = P(255) + P(525) + P(552) = 0.01389$$

• Example 2:  $\vec{X} = <0, 0, 1, 1, 1, 0>$ 

• What is the probability of a particular vector of counts after 3 rolls?

• Example 1: 
$$\vec{X} = < 0, 1, 0, 0, 2, 0 >$$

• 
$$P(\vec{X}) = P(255) + P(525) + P(552) = 0.01389$$

• Example 2: 
$$\vec{X} = < 0, 0, 1, 1, 1, 0 >$$

• 
$$P(\vec{X}) = P(345) + P(354) + P(435) + P(453) + P(534) + P(543) = 0.02778$$

The probability mass function for the multinomial distribution is:

$$f(\vec{x}) = \underbrace{\frac{N!}{\prod_{k=1}^{K} x_k!}}_{\substack{\text{Generalization of binomial coefficient}}} \prod_{k=1}^{K} \theta_k^{x_k}$$

- Like categorical distribution, multinomial has a *K*-length parameter vector  $\vec{\theta}$  encoding the probability of each outcome.
- Like binomial, the multinomial distribution has a additional parameter *N*, which is the number of events.

- Categorical distribution is multinomial when N = 1.
- Sampling from a multinomial: same code repeated *N* times.
  - Remember that each categorical trial is independent.
  - Question: Does this mean the count values (i.e., each *X*<sub>1</sub>, *X*<sub>2</sub>, etc.) are independent?

- Categorical distribution is multinomial when N = 1.
- Sampling from a multinomial: same code repeated N times.
  - Remember that each categorical trial is independent.
  - Question: Does this mean the count values (i.e., each *X*<sub>1</sub>, *X*<sub>2</sub>, etc.) are independent?
    - No! If *N* = 3 and *X*<sub>1</sub> = 2, then *X*<sub>2</sub> can be no larger than 1 (must sum to *N*).

- Categorical distribution is multinomial when N = 1.
- Sampling from a multinomial: same code repeated N times.
  - Remember that each categorical trial is independent.
  - Question: Does this mean the count values (i.e., each *X*<sub>1</sub>, *X*<sub>2</sub>, etc.) are independent?
    - No! If *N* = 3 and *X*<sub>1</sub> = 2, then *X*<sub>2</sub> can be no larger than 1 (must sum to *N*).
- Remember this analogy:
  - Bernoulli : binomial :: categorical : multinomial
